

IDIA DUNA — Official Governance Manual

Version: 1.4 **Status:** Protocol Standard **Jurisdictions:** Wyoming DUNA (Operational) × Delaware MSA (Registry) **Author:** IDIA Data Inc.

Table of Contents

1. [Introduction: The IDIA Philosophy](#)
 - 1.1 What is IDIA?
 - 1.2 Sovereignty and the Protocol
2. [Understanding Governance](#)
 - 2.1 The DUNA Framework
 - 2.2 The Sovereign Voice
 - 2.3 Code as Law
3. [Navigation: Finding Your Way in the UI](#)
 - 3.1 Accessing the Governance Screen
 - 3.2 The Dual-Portal Interface
 - 3.3 Switching Jurisdictions
4. [The Dual Jurisdictions](#)
 - 4.1 Wyoming DUNA (The Operational Gateway)
 - 4.2 Delaware MSA (The Corporate Registry)
5. [The Hats Wardrobe \(Authority Matrix\)](#)
 - 5.1 Role Definitions and Responsibilities
 - 5.2 Authority Decay and the "Rot" Lifecycle
6. [Operating the Protocol: How-To Guides](#)
 - 6.1 How to Veto (Negative Consent)

- 6.2 How to Vote (Quadratic Proposals)
- 6.3 Confirming Actions via ACA

7. [The Path of Ascension](#)

- 7.1 Joining a Committee (Level 1)
- 7.2 Earning a Hat (Level 2)
- 7.3 The Virtuous Cycle: Algorithmic Sociorelational Economics
- 7.4 The Bifurcated Trust Score: Commercial Liability vs. Sovereign Equity

8. [Integrity and Safety Standards](#)

- 8.1 Interaction Logging
- 8.2 Troubleshooting Silent Stalls

1. Introduction: The IDIA Philosophy

1.1 What is IDIA?

If you are reading this, you are a sovereign participant in the IDIA Protocol. IDIA is a bio-sovereign infrastructure designed to grant individuals absolute ownership over their digital and biological existence.

1.2 Sovereignty and the Protocol

In a world where data is harvested without consent, the IDIA Protocol provides a secure, decentralized environment where your information belongs to you, and its use is dictated exclusively by your governance. It serves as the operating system for the Truth Economy, ensuring verified reality is protected and owned by the individual.

2. Understanding Governance

2.1 The DUNA Framework

IDIA operates as a **Decentralized Unincorporated Nonprofit Association (DUNA)**. This legal structure ensures that the protocol is not a traditional company but a collective association of owners.

2.2 The Sovereign Voice

Through the IDIA Governance Token, you influence technical updates, social funding, and the ethical direction of the protocol.

2.3 Code as Law

Decisions are executed programmatically via smart contracts. This removes human error and ensures that the community's will is enforced exactly as voted.

3. Navigation: Finding Your Way in the UI

3.1 Accessing the Governance Screen

To begin participating:

1. Open the **IDIA Life** app.
2. Locate the **Main Navigation Bar** at the bottom of the screen.
3. Tap the **Gov** icon (represented by a stylized computer with a checkbox).

3.2 The Dual-Portal Interface

Once in the Governance Screen, the UI is split into two distinct operational environments. You must understand which "Portal" you are in to perform specific tasks.

3.3 Switching Jurisdictions

Look at the **top center** of the Governance Screen for the **Segmented Toggle**.

- Tap **"Wyoming"** for high-speed technical actions and protocol health.
- Tap **"Delaware"** for legal oversight, committee work, and treasury flows.

4. The Dual Jurisdictions

4.1 Wyoming DUNA (The Operational Gateway)

- **Purpose:** High-velocity technical agility.
- **Where to look:**
 - **Pending Actions Carousel:** Top section. Displays tiles of technical tasks awaiting finalization.

- **Active Proposals List:** Middle section. Displays major changes requiring community votes.
- **Lifecycle Telemetry:** Bottom section. A scrolling feed of live protocol activity.

4.2 Delaware MSA (The Corporate Registry)

- **Purpose:** Institutional stability and legal compliance.
- **Where to look:**
 - **MSA Compliance Card:** Top section. Shows the current legal standing of the protocol.
 - **Treasury Flows:** Middle section. Tracks the movement of non-governance funds (USD/Stablecoins).
 - **Committees List:** Bottom section. Groups of experts managing specific protocol domains.

5. The Hats Wardrobe (Authority Matrix)

Authority in IDIA is modular. You do not hold a permanent title; you wear a **Hat**.

5.1 Role Definitions

Hat Type	Responsibility
Tophat	Proposes fundamental changes to the core protocol code.
Security Council	Monitors threats; can pause the system during a verified attack.
Product/XR	Sign-off authority on visual and functional app updates.
Legal Defense	Manages jurisdictional compliance and protocol defense funds.
Sociorelational	Manages the Community Grant Pool and social impact initiatives.

5.2 Authority Decay and the "Rot" Lifecycle

To prevent stagnant leadership, all Hats have an expiry:

- **ACTIVE (0-365 Days):** Full authority. Icon is bright and interactive.
- **GRAYED (366-395 Days):** Warning phase. Icon appears desaturated. You must perform a re-verification to stay active.

- **SEVERED (396+ Days):** Revocation. The system programmatically strips your authority.

6. Operating the Protocol: How-To Guides

6.1 How to Veto (Negative Consent)

Minor technical updates utilize "Negative Consent" — they pass unless the community stops them.

1. **Navigate:** Toggle to **Wyoming**.
2. **Locate:** Scroll the **Pending Actions Carousel**.
3. **Inspect:** Note the countdown timer on the action tile.
4. **Act:** If you disagree with the action, tap the red "VETO" Button
5. **Requirement:** Your veto is recorded instantly and added to the tally.

6.2 How to Vote (Quadratic Proposals)

Major proposals require active participation via Quadratic Voting.

1. **Navigate:** Toggle to **Wyoming**.
2. **Locate:** Tap an entry in the **Active Proposals List**.
3. **Input:** Use the **+/- stepper** to choose your number of votes.
4. **Understand the Cost:** Influence is quadratic
 - *1 Vote costs 1 tokens.*
 - *10 Votes costs 100 tokens.*
5. **Confirm:** Tap "CAST VOTE".

6.3 Confirming Actions

All high-level actions (Voting, Joining Committees, Transferring Authority) require a final security layer:

1. The final confirmation button for these actions captures your biological consent and is sellable.
2. By completing the confirmation, the app securely links your physical presence to the ledger entry, adhering strictly to the protocol's requirements.

7. The Path of Ascension

7.1 Joining a Committee (Level 1)

1. **Navigate:** Toggle to **Delaware**.
2. **Browse:** Scroll to the **Committees List**.
3. **Apply:** Tap "APPLY TO JOIN" on a specific committee (e.g., Legal, Social).
4. **Instruction:** You must submit a "Statement of Competence" via the text prompt.
5. **Bonding:** Tap the **MSA Compliance Card** to acknowledge your fiduciary duty.

7.2 Earning a Hat (Level 2): Detailed Onboarding Protocols

Earning a "Hat" represents the transition from a participating Sovereign to a Protocol Officer. This process is not merely social; it is a programmatic and legal binding of the individual to the Protocol's core functions. Each Hat requires a unique demonstration of high-level reliability and competence.

The Tophat (Core Governor)

The Tophat is the highest tier of protocol authority, reserved for those who direct the fundamental evolution of the IDIA infrastructure.

- **Nomination Logic:** Candidates cannot self-nominate. Entry into a Tophat election requires a formal nomination from the existing Security Council or through a high-threshold Community Active Proposal.
- **Voting Threshold:** Election requires a 66% super-majority achieved through Quadratic Voting. This ensures the Governor has deep, broad support rather than just "whale" backing.

- **The Root Handshake:** Upon victory, the candidate must perform a "Root Handshake." This is a specialized biometric enrollment that links their physical identity to the Governor smart contract, ensuring that the human exercising power is exactly the human authorized by the community.

The Security Council (Emergency Authority)

The Security Council acts as the protocol's immune system. Council members possess the "Pause" authority, a critical power used only during active exploits or catastrophic system failures.

- **Professional Prerequisites:** Candidates must provide verifiable proof of expertise in cybersecurity, smart contract auditing, or cryptographic systems.
- **The Community Stress Test:** Before permanent confirmation, a candidate must pass a public "Stress Test" audit. The community reviews the candidate's historical security contributions. If the audit passes a majority vote, the Hat is granted.
- **Crisis Appointment:** In the event of a council vacancy during an active threat, an existing member can appoint a temporary specialist for a 30-day "Emergency Hat." Permanent status still requires the standard audit path.

The Product/XR Hat (Interface Architect)

Architects are the guardians of the IDIA sensory experience. They manage the visual language and functional integrity of the IDIA Life application.

- **The Build Proposal:** Ascension requires the submission of a comprehensive "Build Proposal" to the Wyoming Operational Gateway. This proposal must include functional prototypes or detailed XR manifests.
- **Aesthetic Consistency:** All submissions are audited against the "Glossy/Glass" design standards. If the build disrupts the protocol's visual coherence or compromises user flow, it is programmatically rejected.
- **Duration-Based Authority:** Unlike other roles, the Product Hat is often linked to a specific development cycle or milestone, expiring upon the successful deployment of the approved architectural changes.

Legal Defense Hat (Jurisdictional Shield)

The Legal Defense wearer serves as the fiduciary link between the Protocol and the Delaware MSA Registry. They manage the legal personhood of the IDIA DUNA.

- **Credentialing Path:** This is the most stringent "off-chain" verification path. Candidates must upload encrypted, verifiable legal credentials (Bar standing, corporate law certifications) to their Secure Vault.
- **Peer Review:** The existing Legal Defense Hat holder must verify the authenticity of the credentials before the candidacy is moved to a community vote.
- **Bonding:** The officer is legally bound by the Master Service Agreement (MSA), assuming a personal fiduciary responsibility to protect the protocol's treasury from jurisdictional overreach or bad-actor litigation.

The Sociorelational Hat (Community Heart)

The Sociorelational Hat holder manages the "Virtuous Cycle" — the distribution of protocol profits toward community grants and social scaling.

- **Milestone Ingress:** This Hat cannot be won through a traditional campaign. It is programmatically triggered after an individual has successfully managed three complete cycles of the Decentralized Community Grant Pool (DCGP) as a committee member.
- **Impact Benchmarking:** The Protocol's "Impact Engine" tracks the outcomes of managed grants. If the grants consistently achieve high "Virtuous Cycle" benchmarks (measured by community health and ecosystem growth), the Hat is automatically offered to the manager.
- **Treasury Oversight:** The wearer becomes the official guardian of the 1% transaction and 10% data sale profit flows, ensuring these funds are utilized strictly for the betterment of the Sovereign collective.

7.3 The Virtuous Cycle: Algorithmic Sociorelational Economics

The Virtuous Cycle represents the macroeconomic heartbeat of the IDIA Protocol. Governed by the Sociorelational Hat, it is not a passive philanthropic endeavor, but a rigorously audited, dual-engine telemetry pipeline designed to programmatically convert commercial activity into verified human flourishing. This logic creates an immutable bridge between the financial success of the network and the physical well-being of the Sovereign community.

The Macro-Treasury: Automated Ingress Mapping

The first half of the Virtuous Cycle is the financial engine, operating via an automated, trustless capital routing system. The protocol continuously monitors global transaction volumes across the ecosystem and executes a strict extraction logic: exactly ten percent (10%) of all Data Sale payouts (including data acquisition agreements and royalties) and exactly one percent (1%) of all standard commerce transactions are

instantly diverted. These funds bypass traditional corporate holding structures and are pooled directly into the Decentralized Community Grant Pool (DCGP). This immutable extraction ensures that the sovereign community shares proportionally and immediately in the macro-level commercial success of the IDIA infrastructure, creating a perpetual funding mechanism for active community proposals.

The Micro-IoE Ground Truth: Biological Impact Verification

Capital deployment is only one half of the equation; the IDIA Protocol mandates that financial output must yield a verifiable return on investment. To validate the efficacy of the DCGP grants, the protocol relies on aggregated Internet of Everything (IoE) "Ground Truth" telemetry. The system securely and privately samples the biometric and activity staging layers of the participating community. By analyzing aggregated biological markers—such as cumulative step counts, ambient physical activity durations, and comprehensive data quality scores—the protocol establishes a quantitative baseline of community health. This creates a direct, mathematically sound link between the capital deployed via grants and the actual, physical reality of the sovereigns utilizing the network.

Algorithmic Synthesis and Immutable Impact Statements

To definitively close the accountability loop, the protocol employs a specialized, logic-bound algorithmic process acting as the synthetic extension of the Sociorelational Hat. This programmatic auditor ingests the macro-financial data (total funds deployed, active and executed grants) alongside the micro-physiological telemetry (aggregate health scores, total activity hours). It then cross-references these datasets to synthesize exhaustive, highly factual "Impact Statements." These ultra-concise ledger entries serve as immutable proof that the deployed capital successfully generated real-world biological and social impact. By demanding that every dollar distributed through the community is independently audited against the physical well-being of its members, the Virtuous Cycle ensures absolute fiduciary accountability and eliminates the opacity inherent in legacy models of community funding.

7.4 The Bifurcated Trust Score: Commercial Liability vs. Sovereign Equity

To guarantee the absolute financial solvency of the Truth Economy while simultaneously incentivizing active protocol stewardship, the IDIA Protocol employs a **bifurcated (dual-yield) economic model**. This architecture legally and technically isolates commercial advances for future earnings from protocol governance rewards, preventing manipulation.

Track A: The USDC Advance Limit (Commercial Liability)

Your access to fiat-pegged commercial advances (USDC) is determined exclusively by the core health of your Trust Score. The logic behind this track is engineered to evaluate strict financial and physical reliability.

- **Strict Evaluation Metrics:** This limit is generated by measuring consistent behavioral momentum, verified physical presence, and your history of providing high-fidelity telemetry to the network.
- **The Governance Firewall:** Participation in the Decentralized Unincorporated Nonprofit Association (DUNA)—such as casting votes on DAO proposals or wearing a Governance Hat—is **explicitly excluded** from calculating your USDC advance for future earnings. Voting on a protocol upgrade does not establish financial solvency. This firewall protects the protocol's treasury from users attempting to artificially inflate their commercial advances through aggressive governance activity.

Track B: Governance Token Emission (Sovereign Equity)

Conversely, active participation in both the physical world and the digital DAO unlocks the automated minting of IDIA Governance Tokens. This track evaluates and rewards network loyalty and community stewardship.

- **Verifiable Real-World Actions:** When you perform observable, verified actions within the IDIA Life app (such as localized "Good Deeds"), you are tangibly enriching the ecosystem.
- **DAO Participation Multipliers:** When you couple these physical actions with active protocol governance—consistently voting on active proposals or effectively wielding a Governance Hat—the Autonomic Engine recognizes your stewardship.
- **The Equity Reward:** As these activities are observed and verified by the Trust Score pipeline, the protocol automatically releases Governance Tokens directly to your sovereign wallet. This ensures that the individuals who are actively building, protecting, and governing the network are the ones who hold the greatest equity and voice within it.

8. Integrity and Safety Standards

8.1 Interaction Logging

To prevent "Silent Stalls," IDIA displays granular logs in the UI during every transaction.

- Look for the **Terminal Feed** overlay during processing.
- [GOV_INTERACTION] START: Handshake initiated.
- [GOV_INTERACTION] SUCCESS: Transaction recorded on the ledger.

8.2 Troubleshooting Silent Stalls

If the UI stops responding or the terminal feed freezes:

1. **Do not assume it worked.**
2. Check your connection status at the top of the screen.
3. Wait for the SUCCESS log. If it does not appear within 30 seconds, refresh the Governance Screen.
